In the Claims

The following listing of the claims replaces all previous listings of the claims.

1. (Currently Amended) Sealing device (1) with a sensor for a rolling bearing (2), the sealing device comprising:

a sealing shield (7) which is mounted between two races of the rolling bearing (2), and which also comprises;

an encoder wheel (8) which is arranged inside the rolling bearing (2) which is arranged inside the rolling bearing (2) between the two races and the shield (7), and also comprises; and

a detecting sensor (9) which is arranged frontally in relation to the encoder wheel 8 in a respective housing (10) which is presented by the shield (7);

the scaling device (1) is characterized by the fact that wherein the sensor (9) comprises a detection surface and is positioned inside the housing (10) in such a way that the detection surface (9s) directly faces the encoder wheel (8).

- 2. (Currently Amended) Device according to Claim 1, characterized by the fact that wherein the said housing (10) comprises a support wall (16) which supports the sensor (9) in a stable operating configuration suitable for detecting, in which the detection surface (9e) directly faces the encoder wheel (8).
- 3. (Currently Amended) Device according the Claim 2, characterized by the fact that the wherein said wall (16) defines a substantially annular window (15) through the said shield (7) and which is made of substantially elastic material.
- 4. (Currently Amended) Device according to Claim 3, characterized by the fact that the wherein said support wall (16) presents a continuous sealing lip (17) which is arranged in direct contact with a lateral surface (91) of the said senor (9) and which presents a substantially conical conformation which is arranged in such a way that its own top part is opposite the rolling bearing (2) in relation to the shield (7).

97

5. (Currently Amended) Device according to Claim 3, characterized by the fact that the wherein said shield (7) comprises a support element (11) which present a rigidity which is greater than a rigidity of the said support wall (16), and which is arranged in substantial contact with one of the said two races.
